Historical Perspective

The study of ship stability has evolved over centuries from empirical observations to advanced scientific principles. Capt H Subramaniam's book captures this evolution, blending classical methods with modern analytical techniques.

Fundamental Concepts in Ship Stability

Metacentric Height (GM) The metacentric height is a key indicator of initial stability. It is the distance between the center of gravity (G) and the metacenter (M). A higher GM indicates greater initial stability, but excessive GM can lead to uncomfortable rolling motions.

Center of Gravity (G) The point through which the entire weight of the ship acts vertically downward. Its position influences the ship's stability and trim.

Center of Flotation (F) The point about which the ship tilts during heel; closely related to the center of buoyancy.

Righting Arm (GZ) The lever arm through which the buoyant force acts to restore the ship to an upright position after tilting.

Types of Stability

Initial Stability Refers to the stability when the ship is slightly inclined, primarily dependent on the metacentric height.

Transverse Stability The ability of the ship to resist rolling about its longitudinal axis. Critical during navigation in rough seas.

Longitudinal Stability Concerned with the stability about the transverse axis, affecting the fore and aft balance.

Dynamic Stability Stability considered under dynamic conditions, such as waves and maneuvering.

Stability Curves and Diagrams

GZ Curves Graphical representations showing the righting arm (GZ) versus heel angle. These curves help evaluate the ship's stability at various angles of heel.
